[Chip Off The Old Soul](#)

Sick of your life? No problem. Download your soul to a “chip,” go take a nap and come back in a brand new body. This will be possible soon.

Richard Skellett, a founder of [Digital Anthropologist](#) and an expert for Future of Work, has warned of a future in which British workers have chips inserted underneath their skin.

People will be able to download their “souls” onto microchips, implant it into another body and live forever, a technology expert has claimed.

“Living forever might sound crazy at the moment because the technology isn’t quite there, but we already have the technology to clone.”

The microchips from [BioTeg](#) are similar to those for pets and are implanted in the flesh between the thumb and forefinger.

Chips will be able to store medical data and other personal information.

“Your soul is you, it’s your beliefs, it’s your values.

So imagine now that you’ve got a chip, and that chip has been collecting all of your personal details, all of your learning, that effectively becomes our soul.

“It may sound ridiculous, but you may be able to take that chip out and put it in another body and live forever – it’s not actually that ridiculous, is it?”
